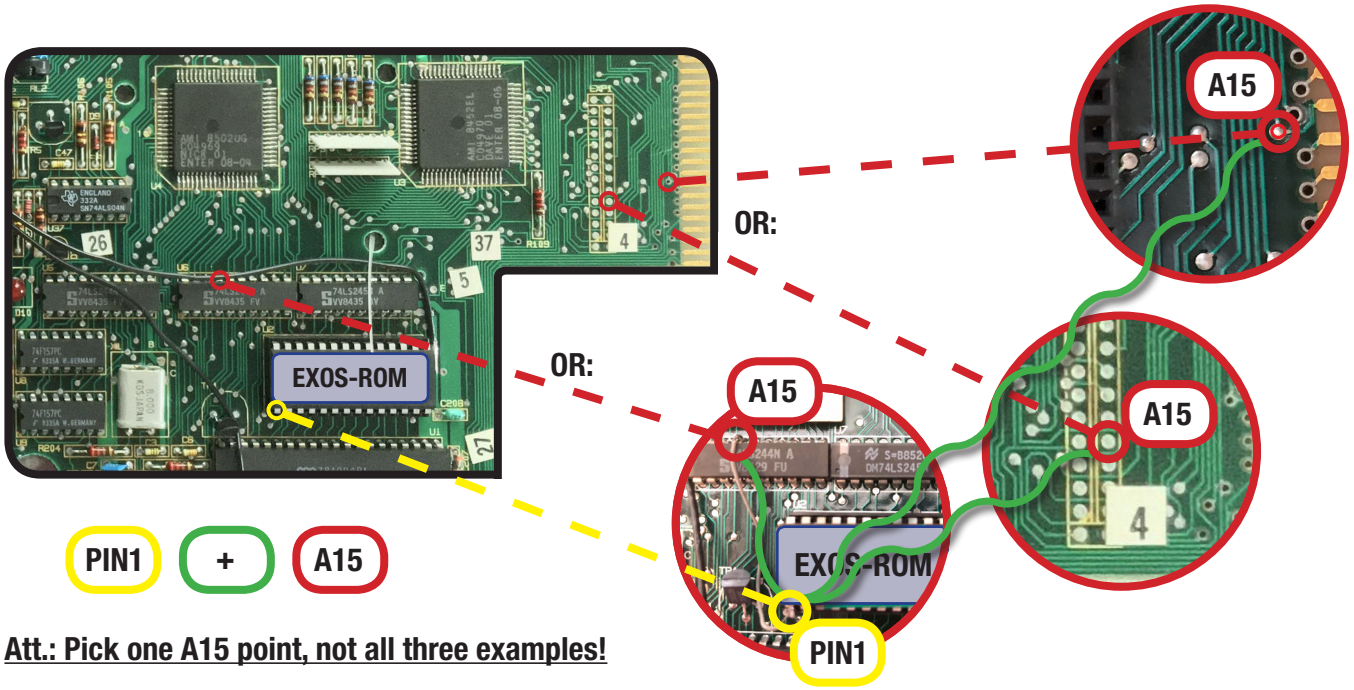
ROM w/ BASIC upgrade

Upgrade the onboard ROM to EXOS 2.4, which have built-in BASIC.
One 64Kb 27C512 (E)EPROM needed, and one wire needs soldering. Solder a wire onto the EPROM **PIN1** (bend the pin up so it doesn't go into the socket) and solder the other end to the **A15** address line.

This ROM upgrade is highly recommended, because many of the available programs are compatible only with EXOS 2.1+, but the EP64 came with the earlier 2.0.

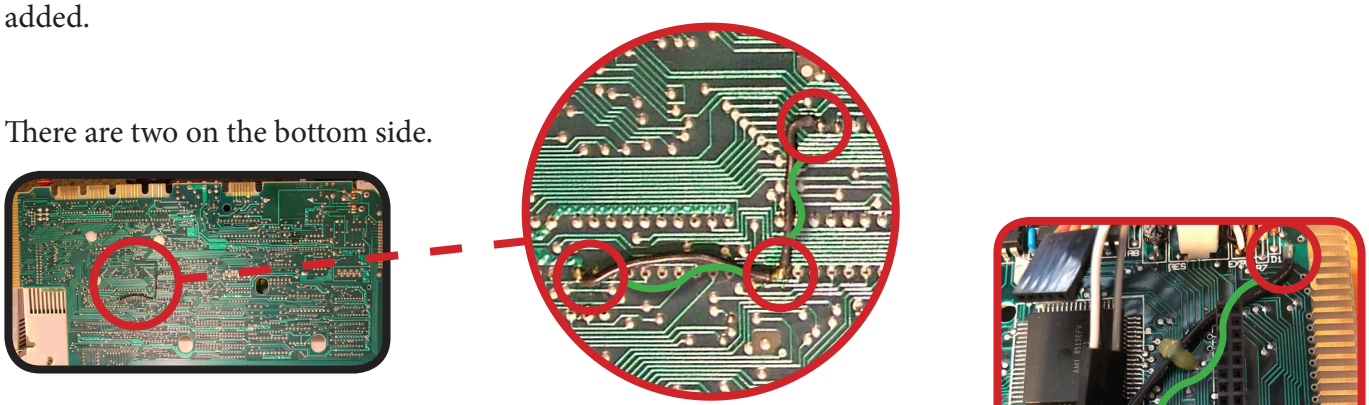


Att.: Pick one A15 point, not all three examples!

GROUNDING / GND patch

GND patch wires; These are missing from most of the EP64 machines. The EP128 machines had these added.

There are two on the bottom side.



And one from near the ROM chip to the expansion connector.
